

Feature Proposal

Readiness Hub — A New Feature for Unstop

Turning Unstop's existing company prep content into a personal, deadline-driven readiness tracker

Prepared by Drishti Singh • Product Case Study • August 2026

Executive Summary

Unstop already connects millions of students to placement drives, company-specific prep content, and skill assessments. What it doesn't do is tell a student, personally, how many days they have left before a specific company's test and how ready they actually are for it. Readiness Hub closes that gap: a lightweight, personal layer that sits on top of content Unstop has already built, turning passive browsing into a daily habit anchored to real deadlines. This document covers the problem, the research behind it, the business case for Unstop, the full feature scope, and a working 5-screen prototype.

1. The Problem

Final-year students preparing for campus placements track multiple companies at once, each with its own deadline and its own required topics. Prep content is scattered across apps, spreadsheets, and WhatsApp groups. Even on Unstop, where much of the relevant content already exists (drives, company prep guides, mock tests), there's no single personal view answering: “how many days do I have left for Company X, and how ready am I?” This creates timeline anxiety with no productive outlet — and it's a gap I experienced firsthand while preparing for my own placements.

2. Why Unstop, Why Now

Unstop is a two-sided marketplace: companies pay for hiring engagements, employer branding, and assessments, while students use the platform for free to discover drives, competitions, and prep content. It already reaches a large, highly relevant student base and hosts Company Preparation content, AI-powered mock tests, and mock interviews — the raw material this feature needs already exists inside the product.

Two things make this the right moment to propose it:

- Unstop's monetization increasingly leans on B2C subscriptions (“Unstop Pro”) and institute-facing services alongside its core B2B hiring revenue — a personal readiness signal is a natural, non-intrusive upsell trigger for exactly that subscription tier
- Engagement depth (daily/weekly active use), not just registered users, is what makes the platform valuable to both students and the employers paying for visibility — a daily-use feature directly strengthens that metric

3. Target User

- Final-year Computer Science (and related) undergraduates already using Unstop to discover placement drives
- Tracking 3–6 target companies simultaneously, across both service-based (TCS, Accenture) and analyst/consulting (Deloitte, EY, KPMG) profiles

4. How It Works — Core Loop

- 1. Student adds target companies — pre-fillable directly from drives they've already saved or applied to on Unstop, or picked from a preloaded list
- 2. Readiness Hub auto-loads the required topic list for that company, linking directly to Unstop's existing Company Preparation content and mock tests for each topic
- 3. Student marks topics as done while studying — tracked once, globally, reflected across every company that needs that topic
- 4. A home-feed widget surfaces “days left” and live readiness % per company, sorted by nearest deadline
- 5. At low readiness with a near deadline, the app prompts a relevant Unstop Pro resource or mock test — the natural upsell moment

5. Integration With Existing Unstop Features

- Company Preparation content — becomes the material behind each checklist item, instead of a static page a student has to remember to revisit
- AI-powered mock tests and mock interviews — become the concrete action behind marking a topic “in progress,” rather than a self-reported checkbox alone in v2
- Saved/applied drives — pre-populate the timeline tracker automatically, removing manual setup friction entirely
- Unstop Pro — readiness gaps become a contextual, well-timed upsell surface instead of a generic paywall

6. Value to Both Sides

Value to Students	Value to Unstop
One view of every target company's deadline instead of scattered tracking across apps and spreadsheets	Converts a browse-and-leave listings visit into a daily-return habit — directly targets session frequency, not just reach
Turns existing Unstop content (company prep guides, mock tests) into a personal, trackable checklist instead of a static resource page	Surfaces existing Company Preparation and Mock Test content more often, increasing consumption of assets Unstop already built
A readiness score gives a concrete, motivating signal instead of vague anxiety	Readiness data is a natural upsell trigger for Unstop Pro (“unlock a personalized plan to close your gap”) and for institute dashboards
Reduces the cost of using multiple prep tools by consolidating tracking in the app they already use for drives	Aggregate readiness data across students is a new, defensible data asset for employer-facing analytics and recruiter matching

7. Scope — v1

Manual/semi-automated input (pre-filled from existing Unstop drive data where possible), self-reported topic progress. No new external integrations required — this keeps the feature shippable inside Unstop's existing app shell.

Feature	Reach	Impact	Confidence	Effort	Priority
Company timeline tracker (add companies + dates)	High	High	High	Low	Must-have – v1
“Days left” countdown widget	High	High	High	Low	Must-have – v1
Global topic tracker, linked to existing Unstop prep content	High	High	High	Med	Must-have – v1
Readiness score per company	High	Med	Med	Med	Should-have – v1
Unstop Pro upsell prompt at low-readiness moments	Med	High	Med	Low	Should-have – v1
Smart auto-generated daily plan	Med	High	Low	High	Could-have – v2
Peer / batch benchmarking	Med	Med	Low	Med	Could-have – v2
Institute-facing readiness dashboard (for TPOs)	Low	High	Low	High	Could-have – v2

8. Readiness Score Formula (v1)

$Readiness \% = (topics\ marked\ complete\ that\ are\ required\ for\ that\ company) \div (total\ topics\ required\ for\ that\ company)$

Example: Deloitte requires [Aptitude, English, Computer Fundamentals, HR]. Completing 3 of 4 → 75% readiness. Unweighted for v1; weighting by topic importance is a defined v2 improvement.

9. Research: Company → Topic Requirement Mapping

Reference data used to auto-populate each company's checklist, based on current 2026 hiring pattern research.

Company	Assessment Structure	Mapped Topics
TCS (NQT)	Foundation (Numerical, Verbal, Reasoning – 65 Qs) + Advanced coding section, ~190 min, no negative marking	Aptitude, Verbal, Reasoning, DSA-basic

Deloitte	90-min OA – English, General Aptitude, Computer Fundamentals, + a 4th section, followed by one combined technical-HR interview	Aptitude, English, Computer Fundamentals, HR
Accenture	Cognitive Assessment (Verbal, Reasoning, Numerical) + technical/skill sections (Cloud, Networking, Cybersecurity, coding in Python/Java/SQL) + Communication Assessment	Aptitude, SQL, Coding, Communication/HR
EY	Aptitude + case/business reasoning round, followed by technical-HR interview (typical Big 4 pattern)	Aptitude, Case Reasoning, HR
KPMG	Online Assessment (numerical/logical/verbal, often via Mercer Mettl) → Group Discussion or Case Study round → HR interview	Aptitude, Case Study/Business Reasoning, Group Discussion, HR

Most required topics overlap across companies — only 1–2 are truly unique per company. This is the core value of tracking topics globally rather than duplicating tracking per company, and it's what makes the feature genuinely lightweight to use.

10. Design Principles — Inspired by CRED, Fixing Its Gap

Design Decision	Inspired By	Why It Matters
Deadline countdown as the visual anchor on every screen	CRED anchoring rewards to a mandatory action (bill payment)	Deadline anxiety already exists for students — the feature channels it instead of creating a new habit from scratch
Global topic tracker (practice once, updates every company)	CRED's own weakness — no reason to open the app outside the bill-payment window	Gives students a reason to open Unstop daily, not just when browsing new drives — fixes the gap CRED itself never solved
Readiness % as a shareable, status-like signal	CRED's exclusivity framing (credit score gate)	Gives students something to improve and show off, without gatekeeping anyone out — inclusive version of the same psychological hook

11. Prototype

Five core screens covering the loop end to end, designed as if native to Unstop's existing navigation — not a standalone app.

- Dashboard — all target companies sorted by nearest deadline, with a live readiness ring per company
- Add Company — select a company, set OA/interview dates, auto-preview required topics linked to Unstop's prep content
- Company Detail — full topic checklist for one company plus a visual OA-to-interview timeline
- All Topics (Global Progress) — every topic tracked once, tagged with every company that needs it
- Profile — streak, overall progress, and daily reminder preferences

12. Success Metrics

- **North Star:** % of students who complete their prep plan before their nearest deadline
- Product: daily active usage in the 7 days before a deadline; weekly return rate of Readiness Hub users vs. non-users
- Business: Unstop Pro conversion rate among students shown a readiness-triggered upsell, vs. baseline conversion

13. Rollout Plan

- Phase 1 (Pilot): Ship to students at 2–3 partner colleges already active on Unstop, limited to the 5 researched companies
- Phase 2: Expand company list based on pilot usage data, add verified progress via mock test completion
- Phase 3: Institute-facing readiness dashboard for Training & Placement Officers — aggregate, anonymized readiness trends per batch

14. Risks and Mitigations

Risk	Why It Could Happen	Mitigation
Low adoption — students don't set up their first company	New feature buried in an already content-heavy app	Pre-populate from a student's existing saved/applied drives on Unstop so setup is near zero-effort
Self-reported progress is inflated or abandoned	No verification tied to actual practice	v1 accepts this tradeoff deliberately; v2 can link topic completion to actual Unstop assessment attempts for verified progress
Cannibalizes time spent browsing new opportunities	Students might spend more time tracking than discovering	Surface the Readiness Hub as a widget on the existing home feed, not a separate destination that competes for attention

15. What We'd Cut and Why

Auto-generated smart plans and peer benchmarking were cut from v1 despite high potential impact, since they need either weighting logic or social data infrastructure that isn't justified until the core loop is validated with real usage inside Unstop. Verified (non-self-reported) progress was deferred to v2 for the same reason — it requires deeper integration with Unstop's assessment engine than a v1 pilot needs.
